

# Event App Project

## Project Brief

This project is a full stack event app that will allow the Creation, Reading, Updating and Deleting of events.

## Your Project

The Event App should include the following functionality:

1. A single page application.
2. Visitors arriving at the site are presented with a login screen.
3. The App will pass login credentials to the API which will check these against the db.
4. A logged in user will be able to:
  - a. View a list of events
  - b. Add a new event to the list
  - c. Update an existing event with new information
  - d. Delete an event
5. Each event should include the following information:
  - a. Name
  - b. Location
  - c. Precis of event information.
  - d. Date / time of event.

## Deliverables

The GitHub Pages URL for the front end

The GitHub Repository URL for Front end, and the API

## Extension

The app could be extended by allowing the user to view events by location or date or find an individual event by id or name.
